Did you know that...

1 out of 5 schoolchildren in CAR is underweight?

The 2003 National Nutrition and Health Survey (NNHes) conducted by the Food and Nutrition Research Institute of the Department of Science and Technology (FNRI-DOST) revealed that in the Cordillera Administrative Region (CAR), 21.7 percent of schoolchildren (6-10 years old) were underweight.

This means that 1 out of 5 schoolchildren weighed less than normal children of the same age. Prevalence of underweight among pre-school children (0-5 years old) was lower at 16.3 percent. Prevalence rates in CAR across both age groups were lower than the national.

PROPORTION OF UNDERWEIGHT AND UNDERHEIGHT CHILDREN: CAR, 2003

Area	Preschoolers				Schoolchildren			
	Under Weight	% CV	Stunted	% CV	Under Weight	% CV	Stunted	% CV

updating is done in between survey periods through the survey, *Updating of Nutritional Status of Filipino Children*. The reference period of the NNHes is June-September.

Percentage of 0-10 Years Old Children by Various Forms of Malnutrition, Philippines and CAR, 2003

Results of the survey also showed that the proportion of stunted or underheight pre-school and schoolchildren was higher than the national average at 30.0 and 37.7 percent, respectively. This means that about 3 out of 10 preschoolers and nearly 4 out of 10 schoolchildren in CAR had height less than normal children of the same age. Stunting indicates that a child is either malnourished in the past or suffering from lingering or chronic malnutrition.

The NNHes aims to re-assess the nutritional status of the population for appropriate formulation and modification of nutrition policies and interventions and related development programs. The survey is conducted every five years although
